

Integrating invasive species management in forest and landscape conservation

Danijela Puric-Mladenovic

NHIC, Science and Research Branch, OMNRF

October 26, 2016

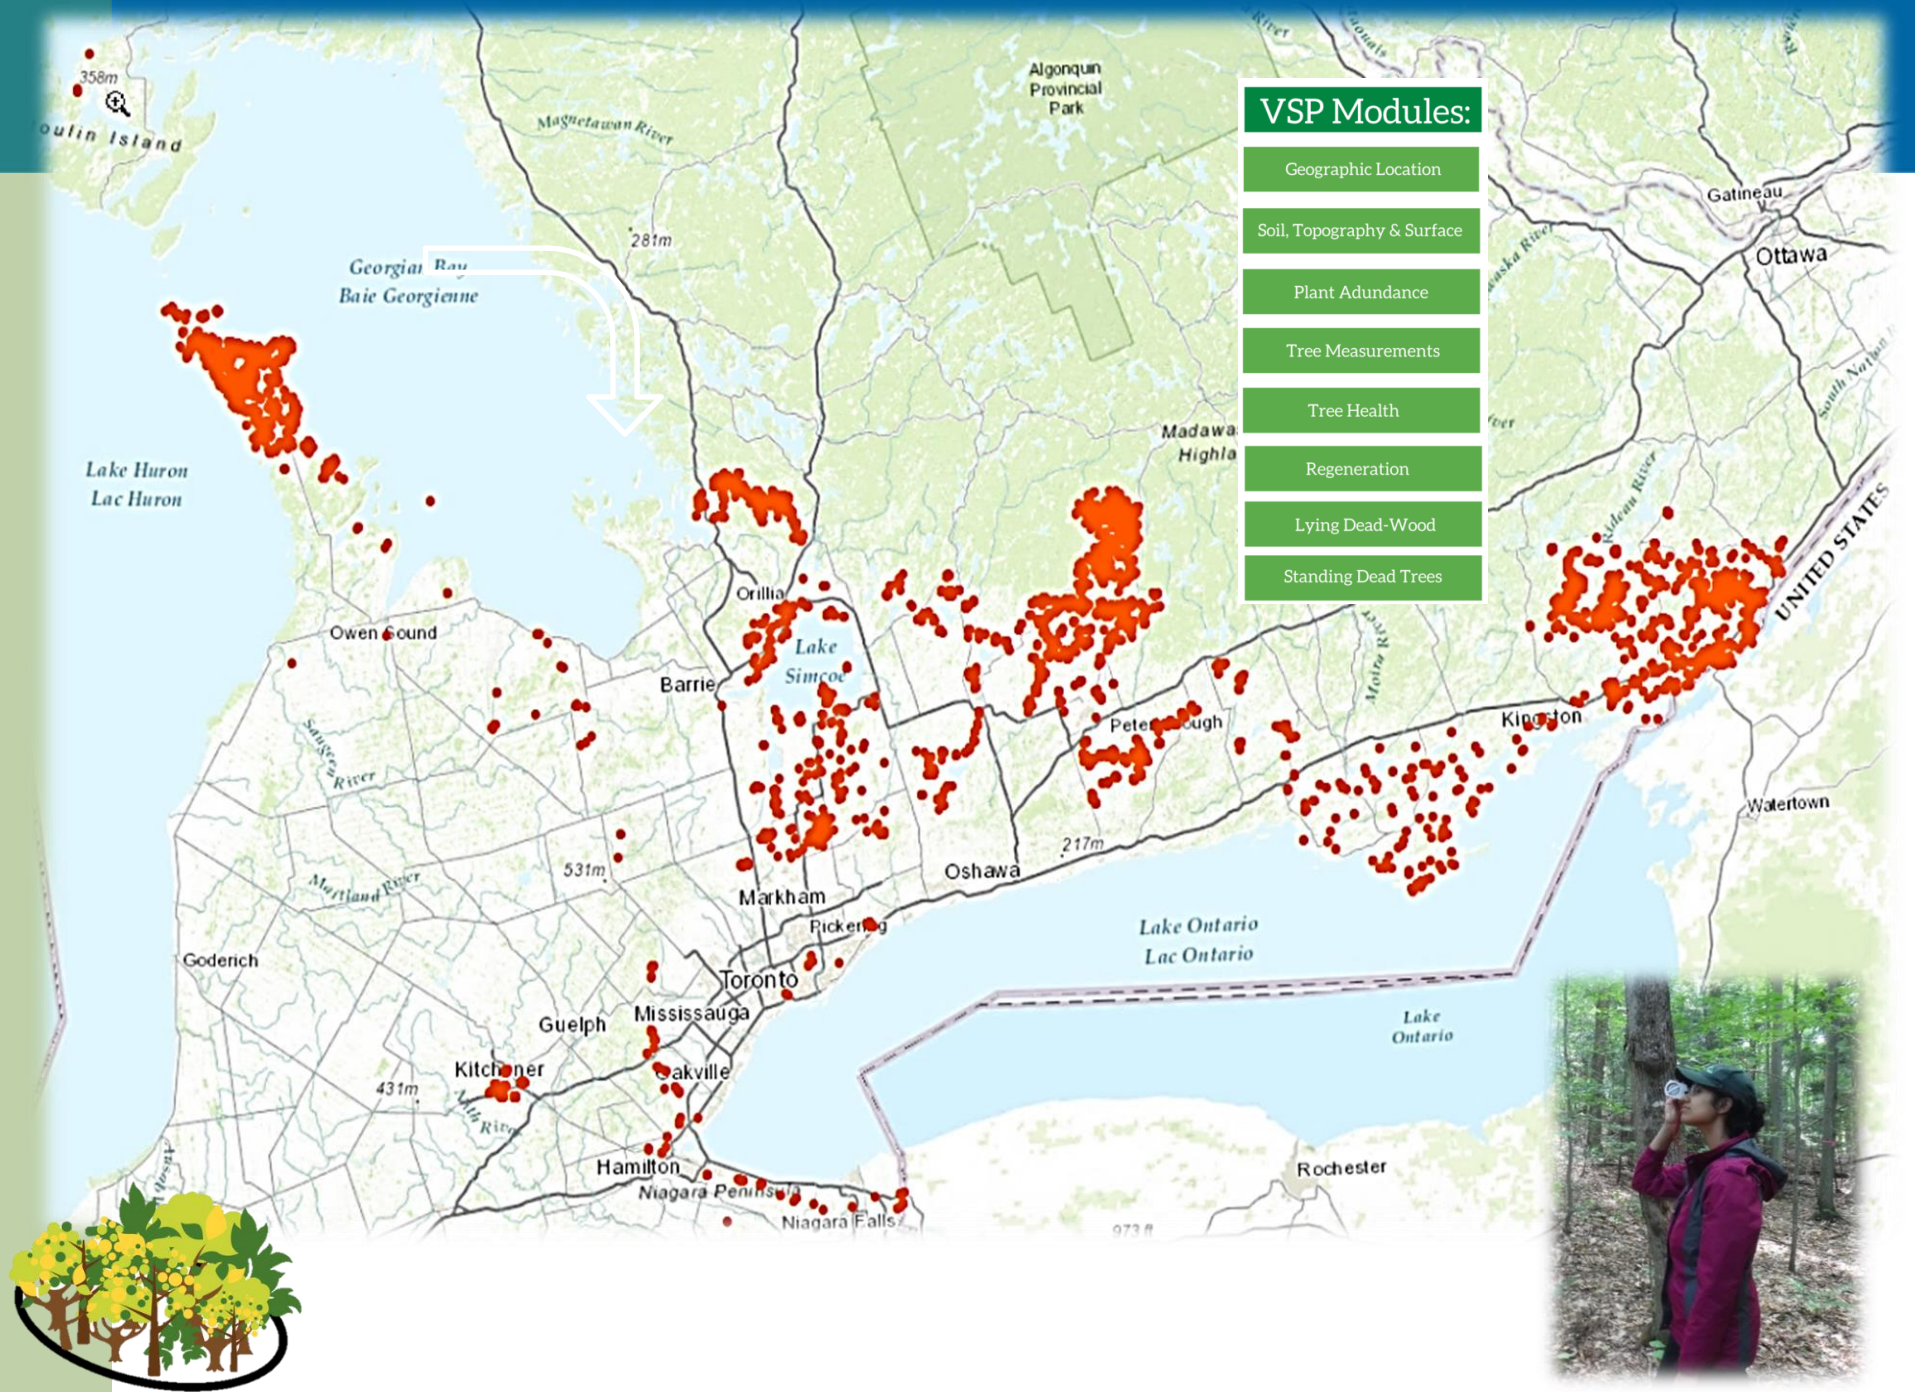

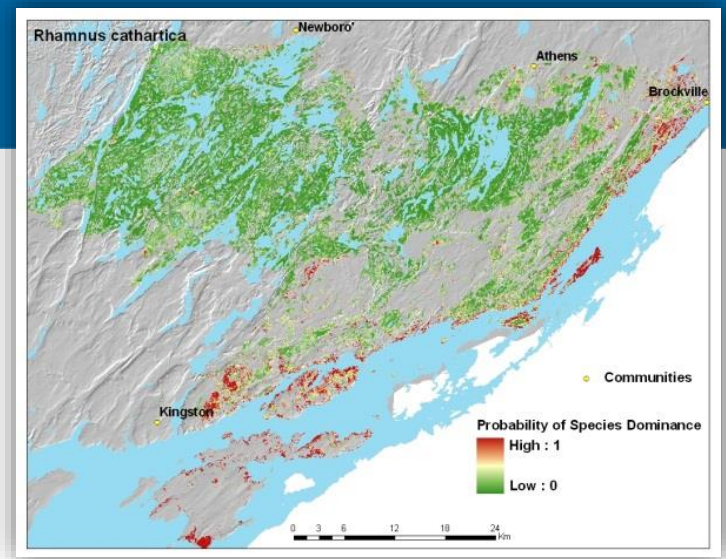

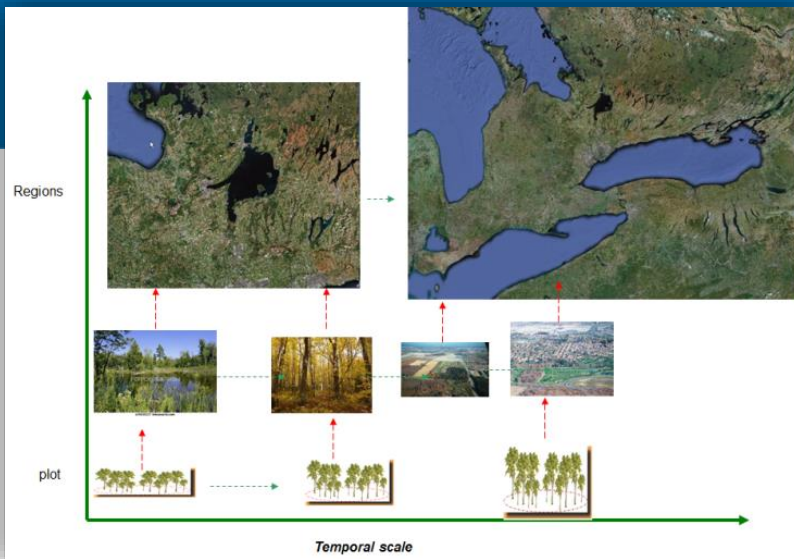

- Invasive species need to become a necessary component of landscape planning and biodiversity conservation.

VSP* inventory and monitoring

- Integrate invasive species sampling.
 - Presence, Abundance, and Absence
- Capture standard, cost-efficient information on invasive species
- VSP can also be used to support specific needs of invasive species inventory and monitoring.
 - E.g.. to compare invaded sites to the rest of the landscape; define reference sites and conditions

**VSP-Vegetation Sampling Protocol*

- Applicable to
 - Landscape/ regional needs
 - Stand / property / parcel sampling
 - Plot level sampling

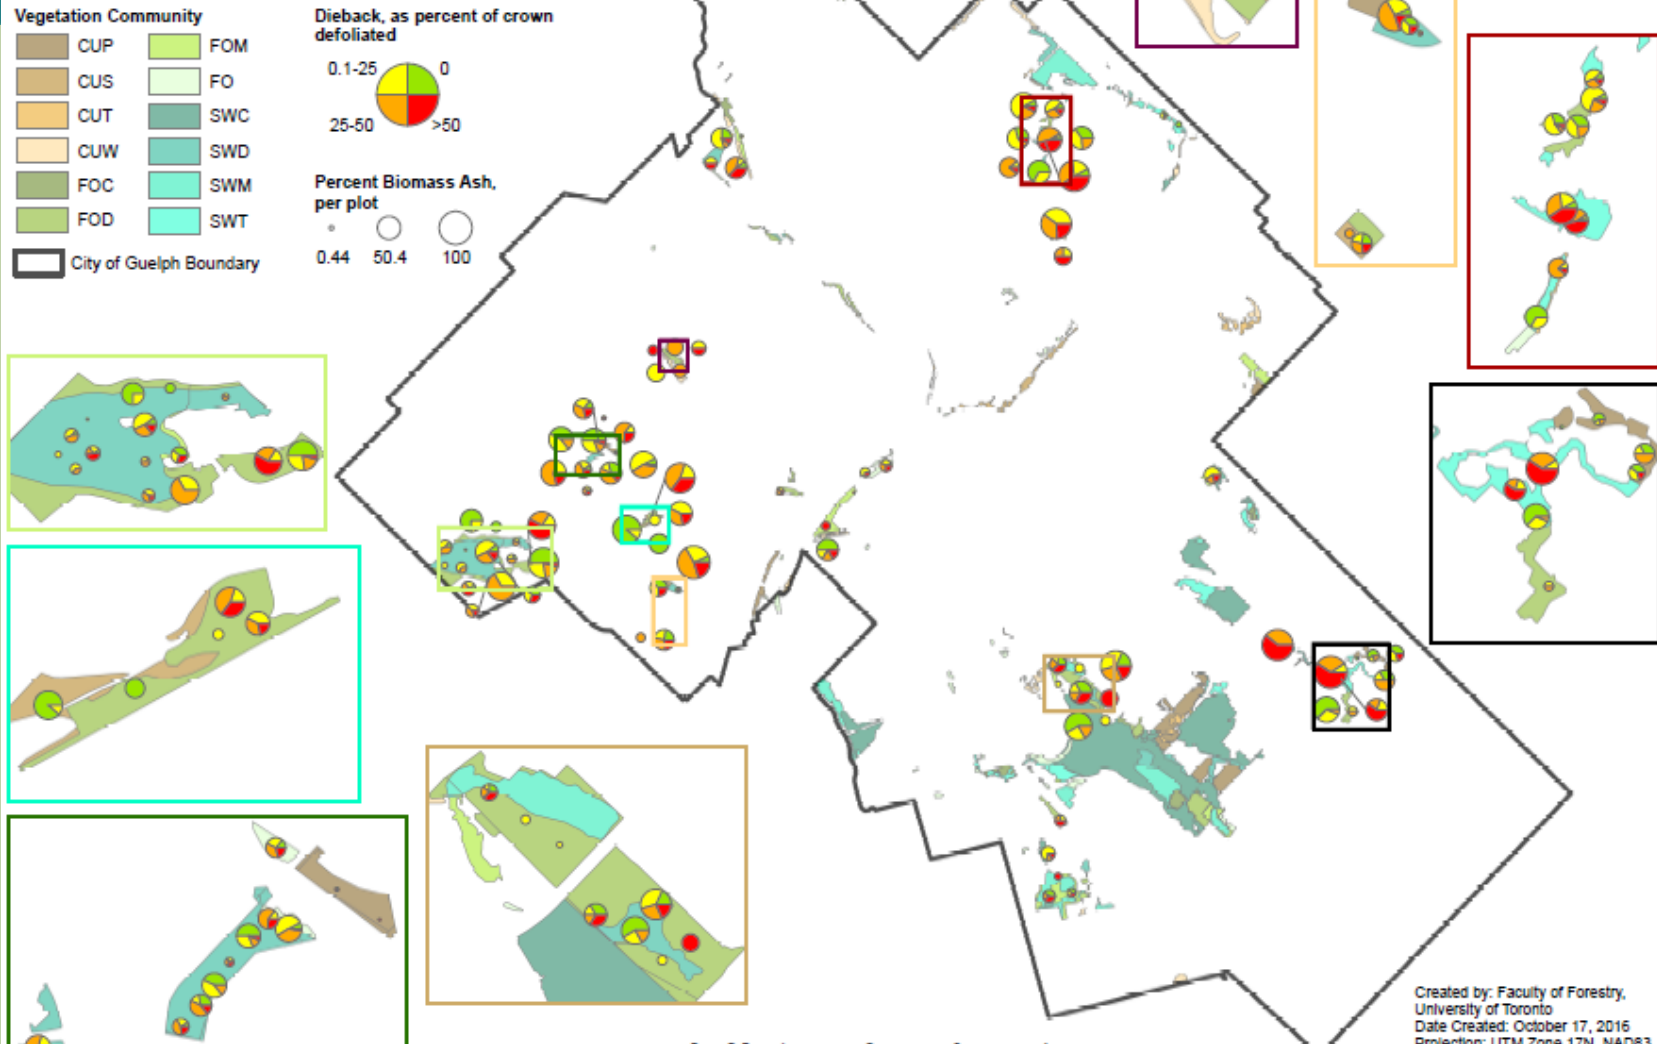

Loss of Ash due EAB impact

Ash Canopy Dieback, Guelph ON (2016)

ario

In some areas Ash makes on average
30% of total biomass

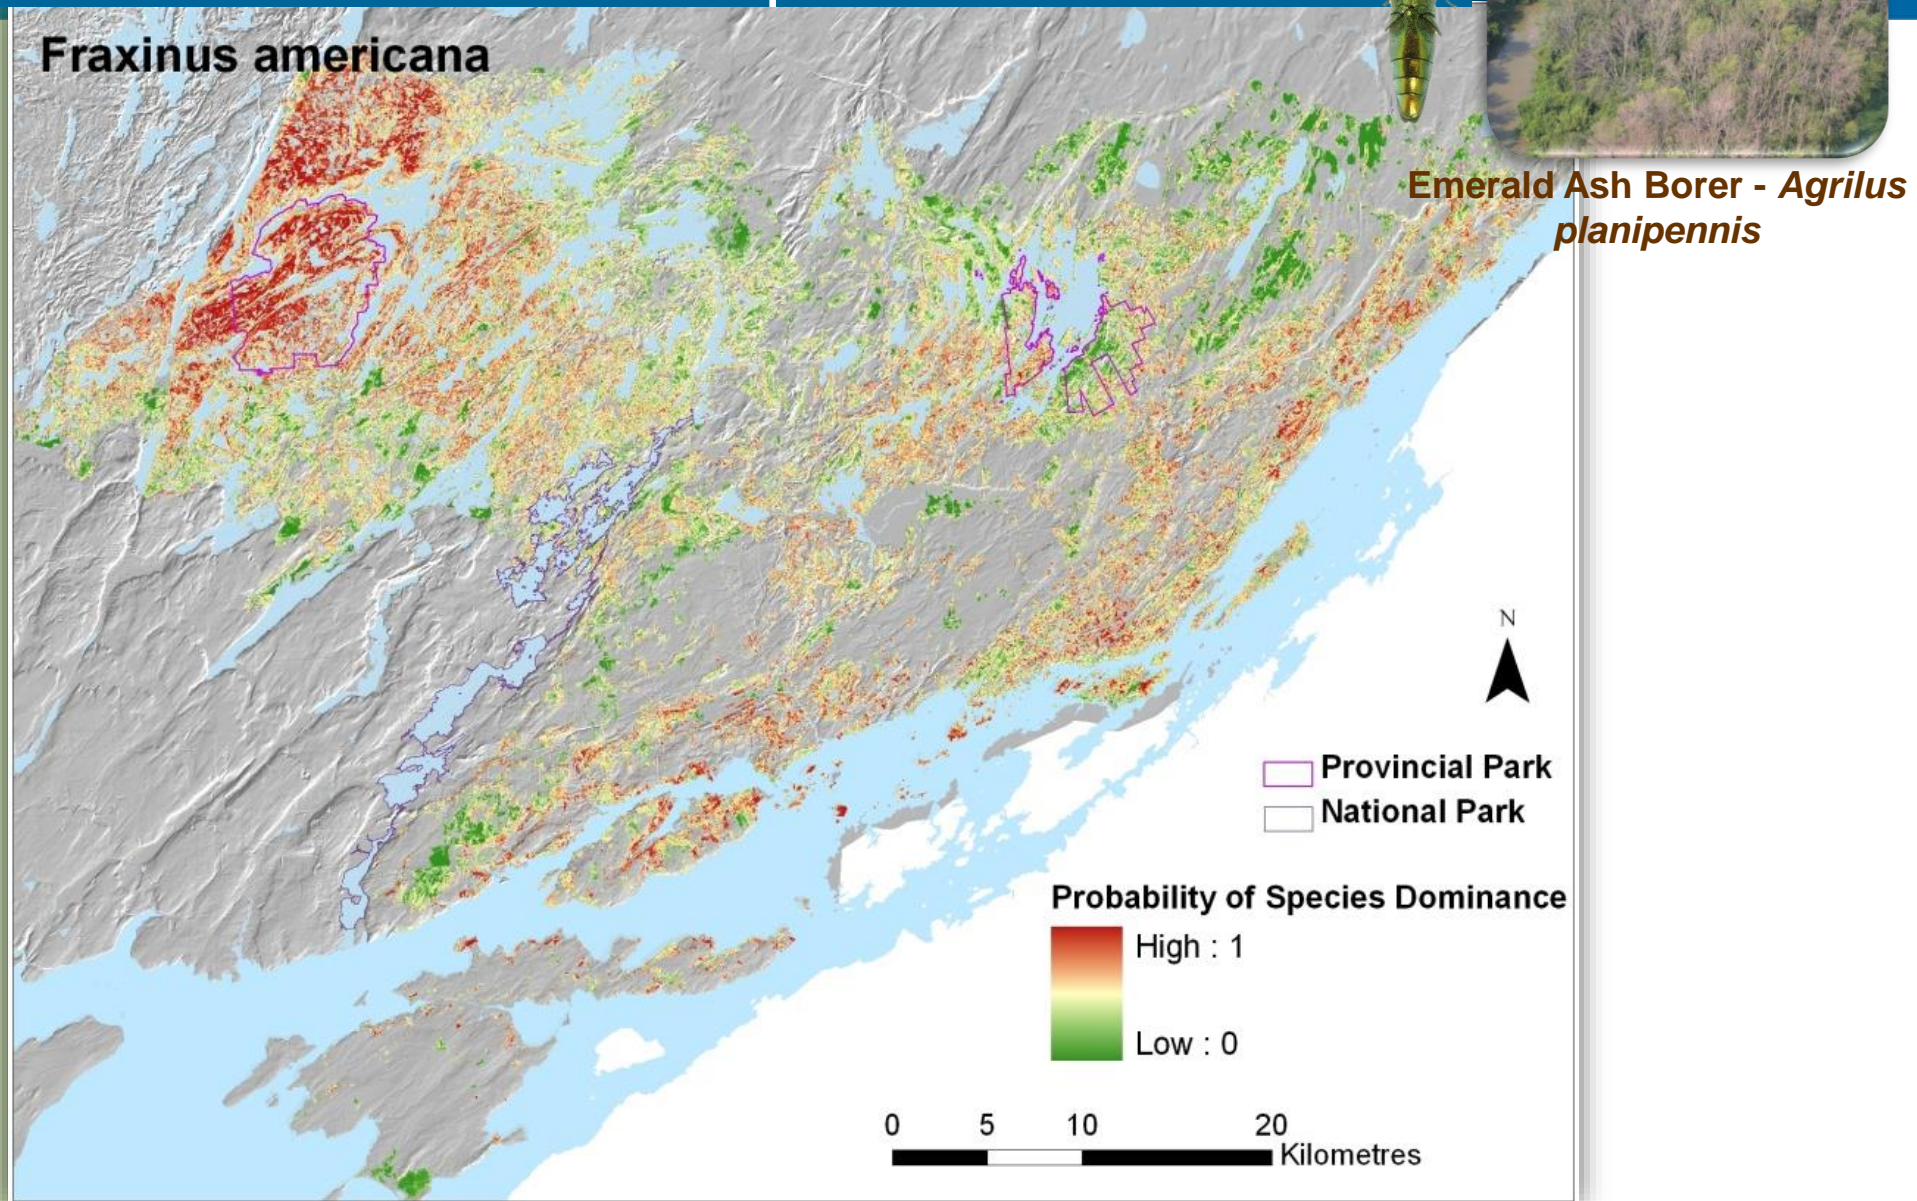

Percent Ash biomass

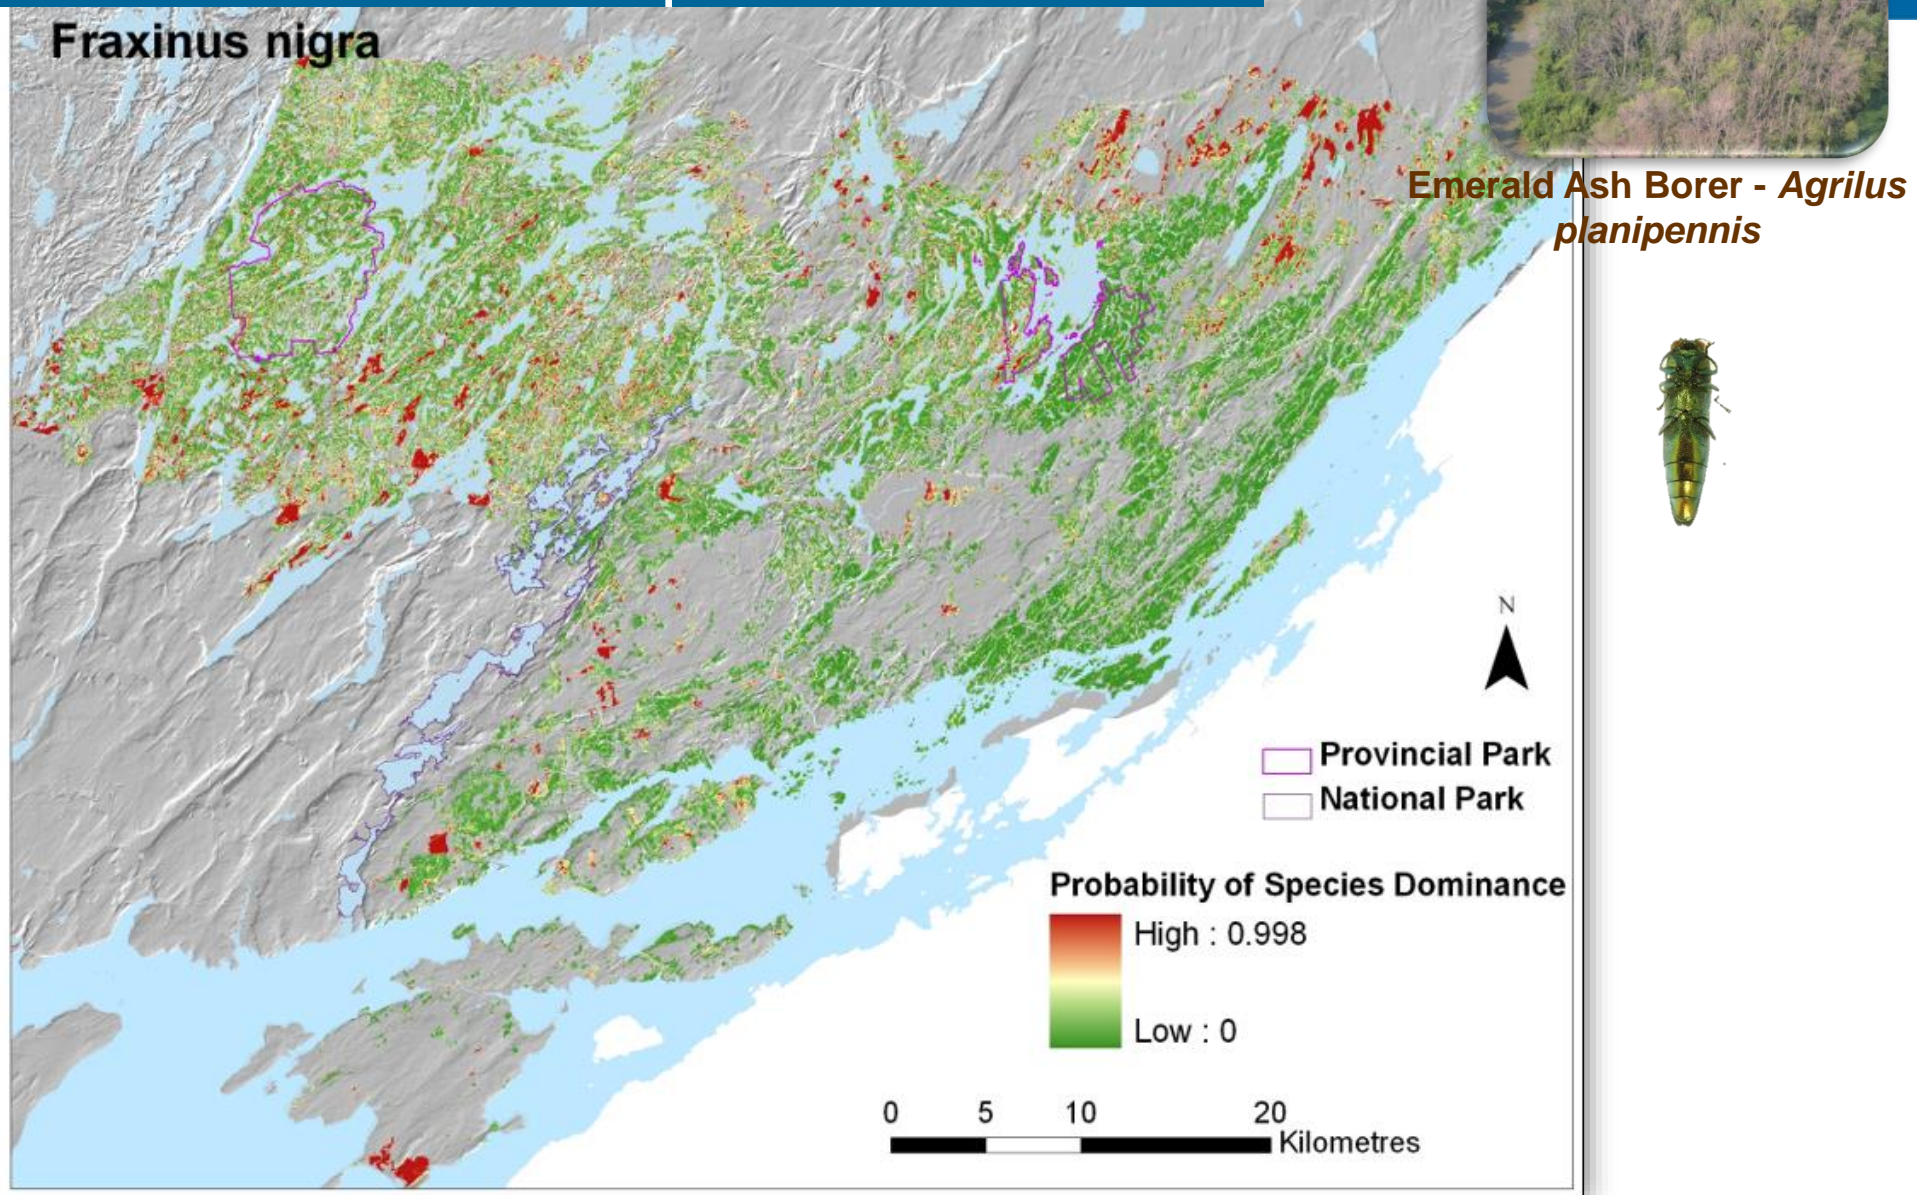

Ash biomass is often more than 40%

What is the extent of Ash across landscapes ?

Modeled distribution of White Ash based on VSP plots

What is the extent of Ash across landscapes ?

Modeled distribution of Black Ash

What is coming after Ash?

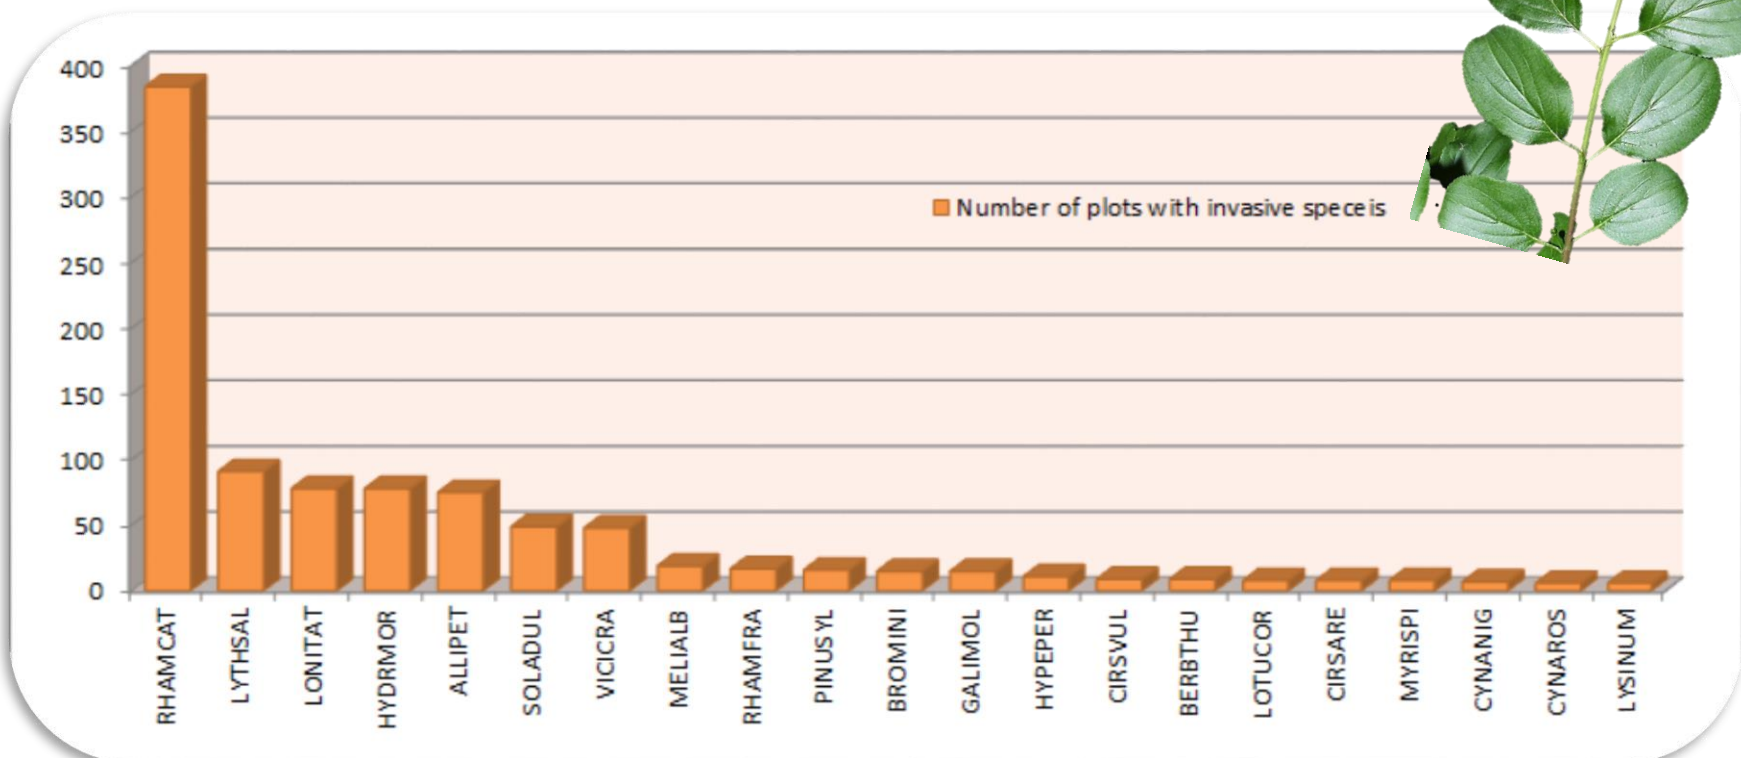

Swamps:

What is going to come after Black and Green Ash (and Elm) ?

Forest regeneration

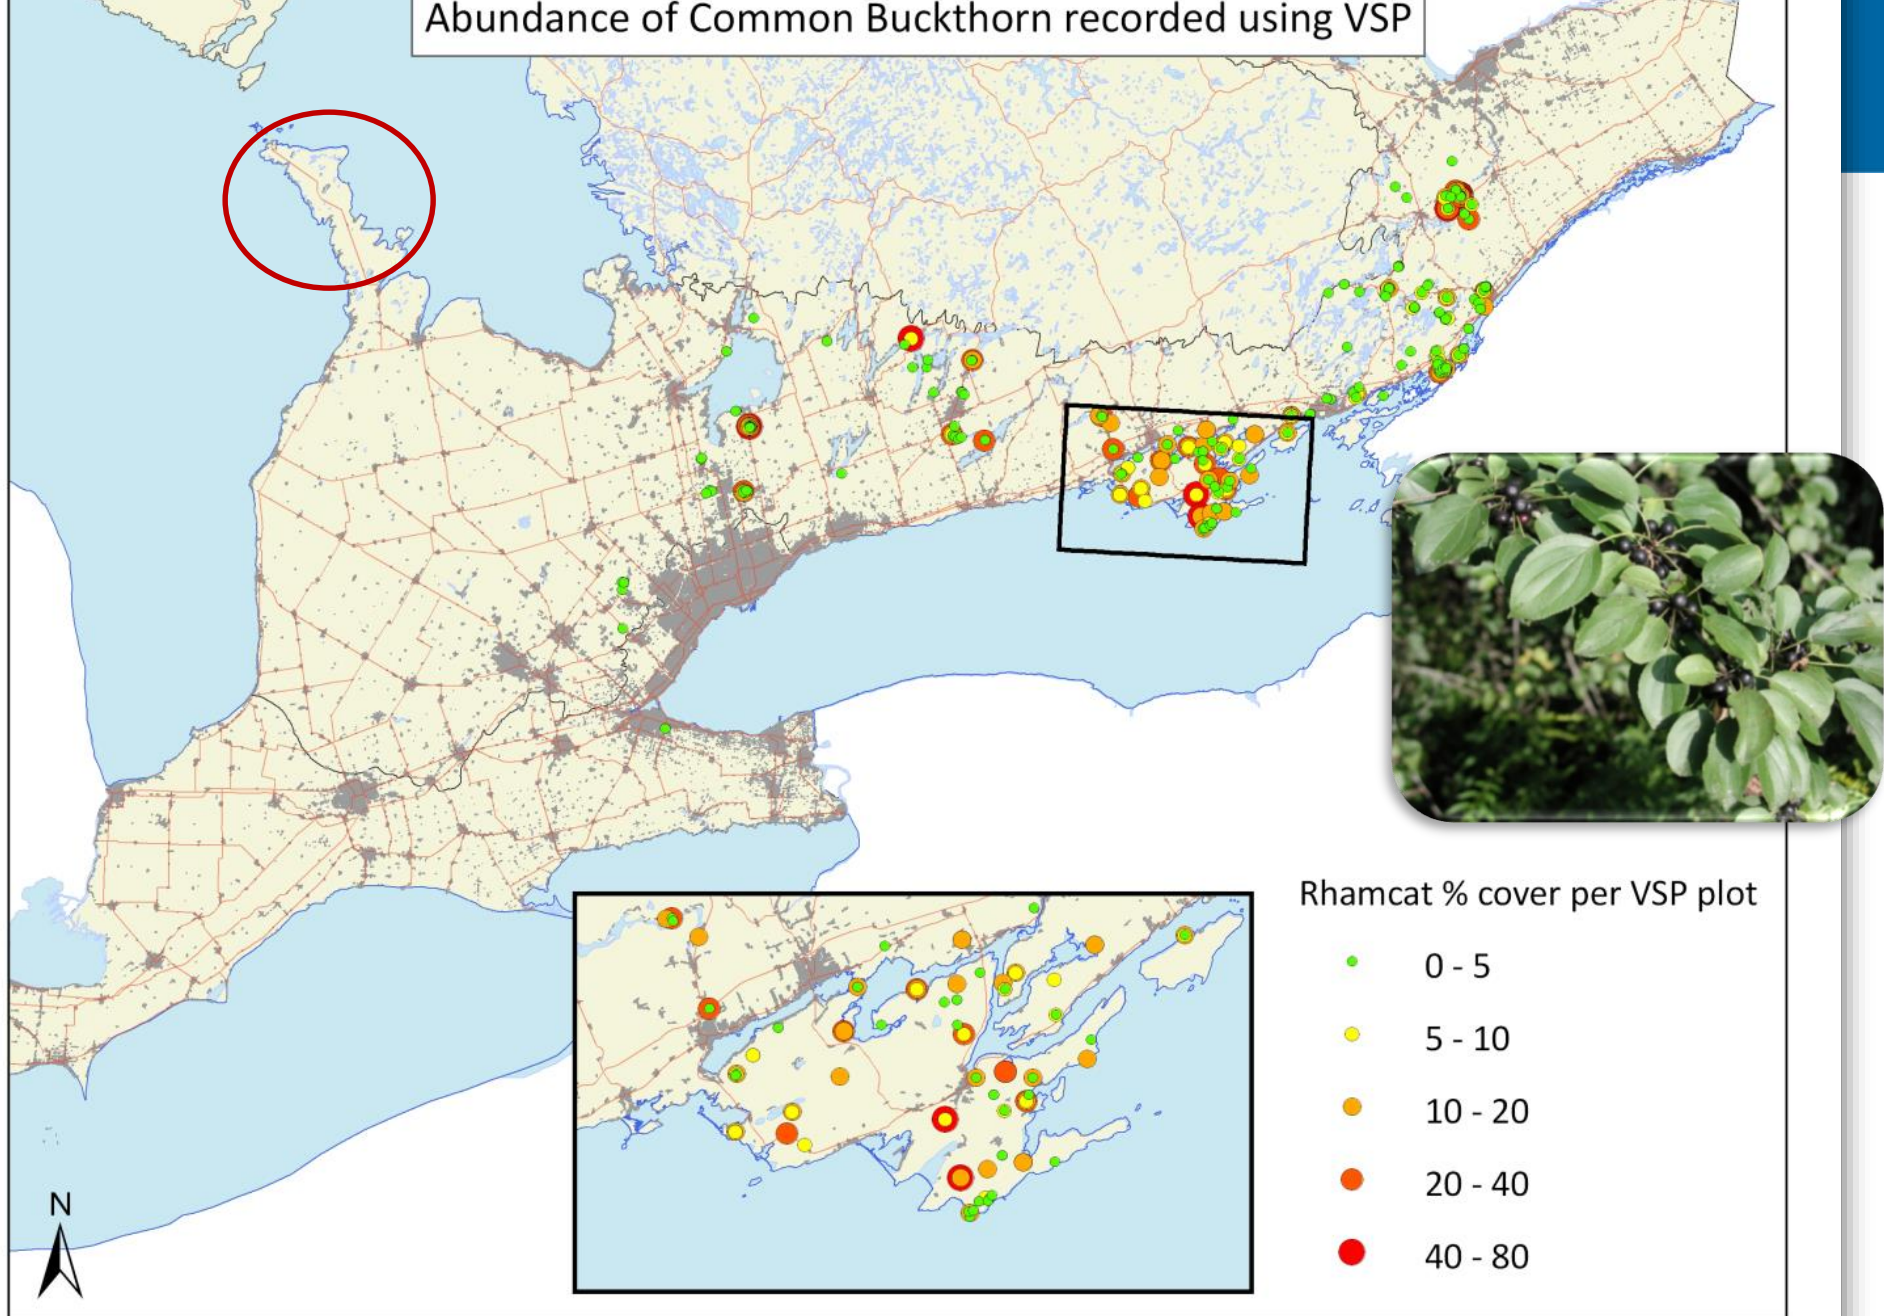

Buckthorn is the most frequent invasive plant

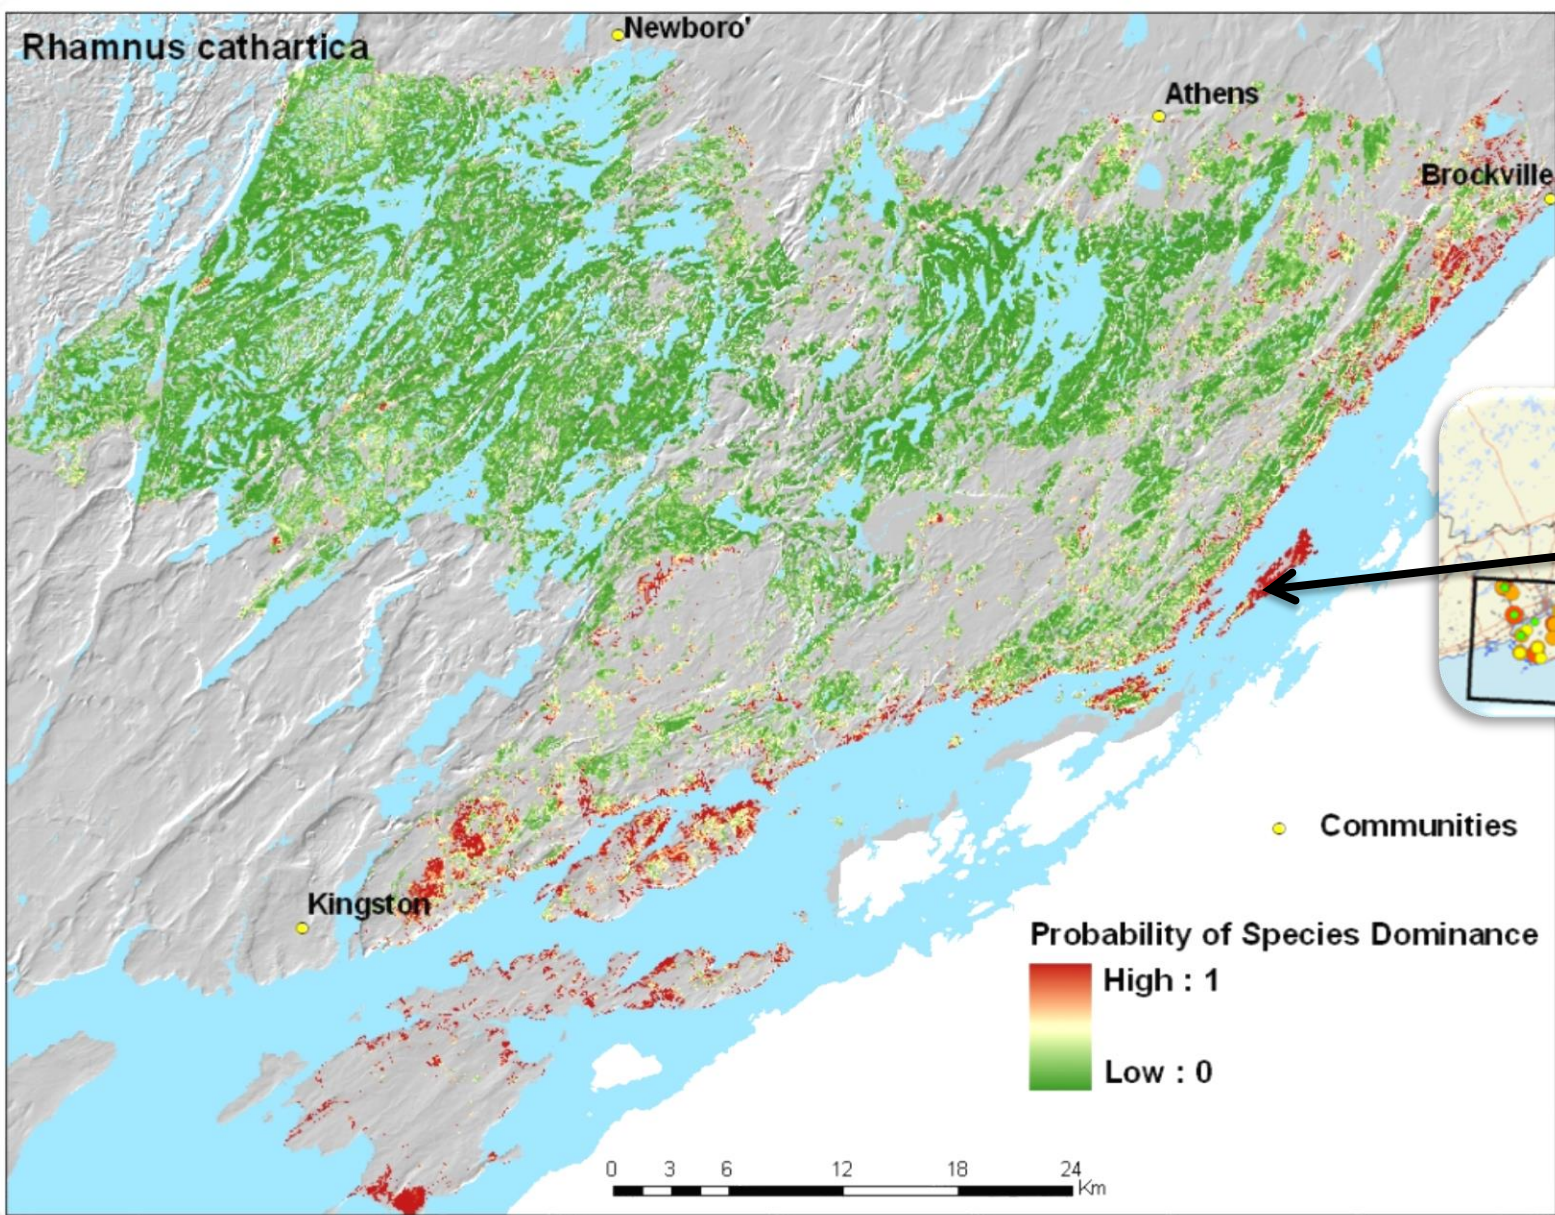

EXPRESSED AS NUMBER OF PLOTS IN WHICH A SPECIES WAS SAMPLED.

SPECIES NAMES ARE COMPOSED BY THE FIRST FOUR LETTERS OF THE GENUS NAME AND THE FIRST THREE LETTERS OF THE SPECIES NAME. FOR EXAMPLE, GARLIC MUSTARD IS "ALLIPET".

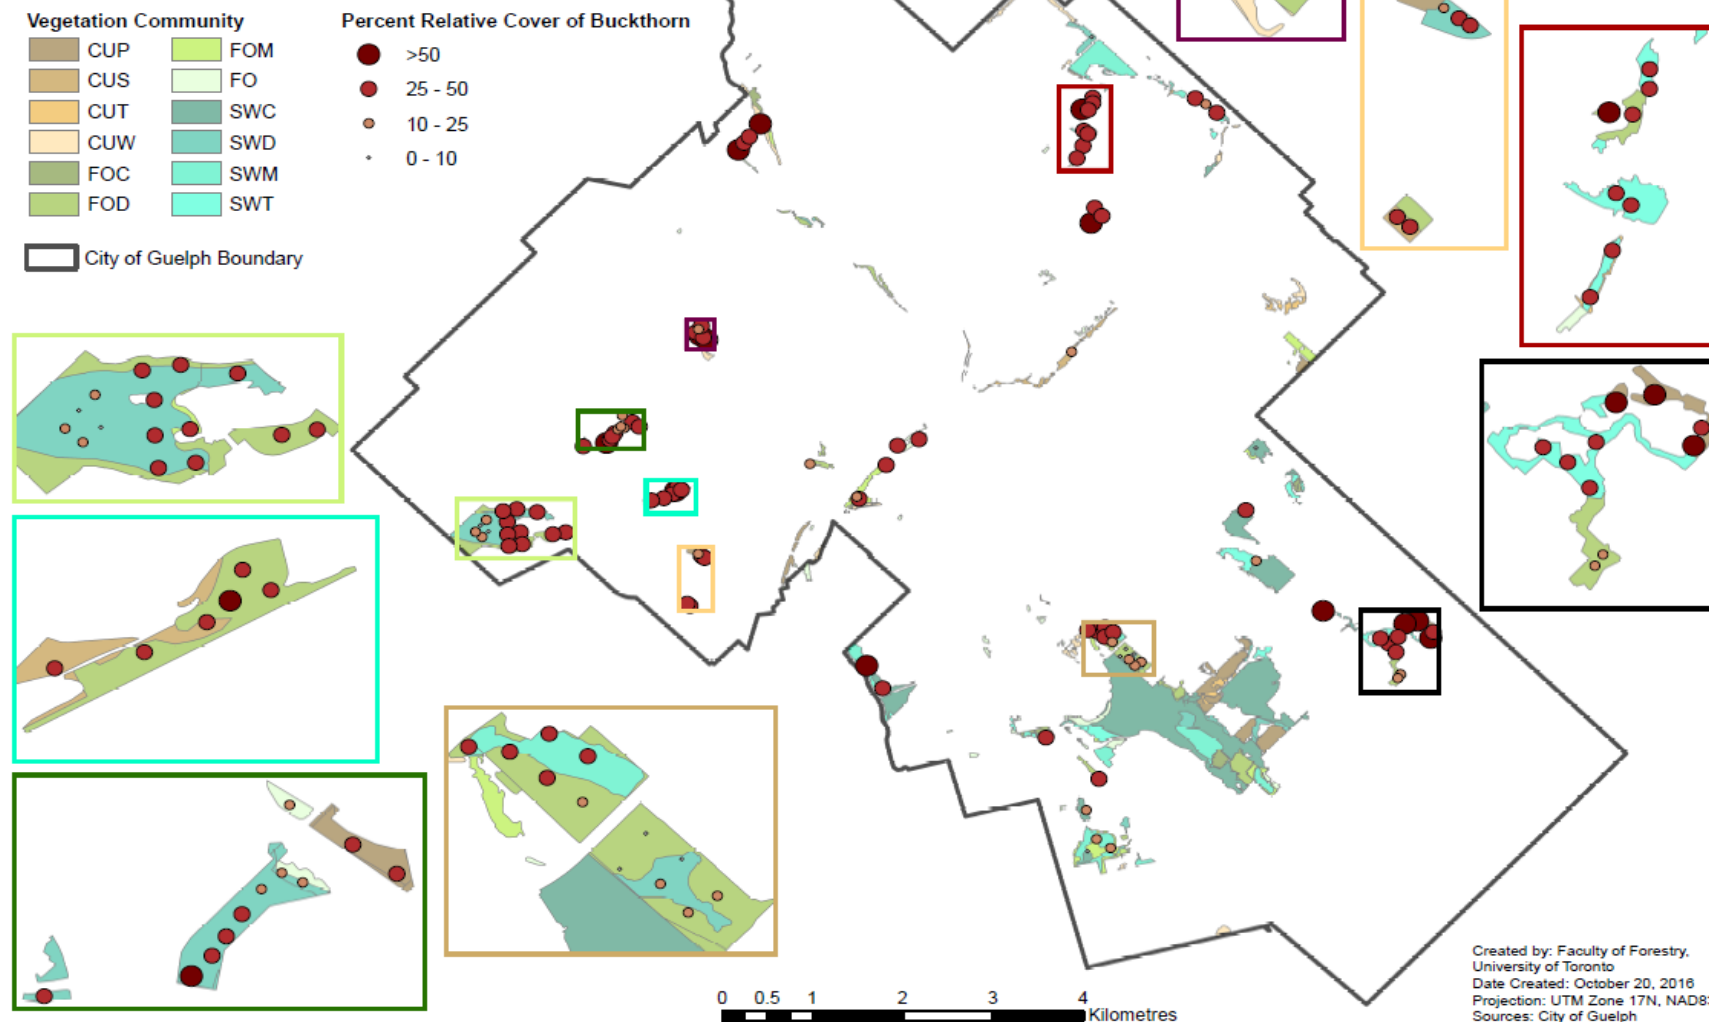

Abundance of Common Buckthorn recorded using VSP

MODELED DISTRIBUTION OF EUROPEAN BUCKTHORN (*RHAMNUS CATHARTICA*) FOR ECODISTRICT 6E10. THE MODEL WAS DEVELOPED USING VSP PLOT DATA. RED INDICATES AREAS WITH A HIGH PROBABILITY THAT EUROPEAN BUCKTHORN IS A DOMINANT SPECIES, AND ARE MOSTLY CONFINED TO AREAS ADJACENT TO THE ST. LAWRENCE RIVER CORRIDOR.

Relative Abundance of Invasive Buckthorn per VSP Plot in Guelph, ON (2016)

Buckthorn in Ash woodlots.

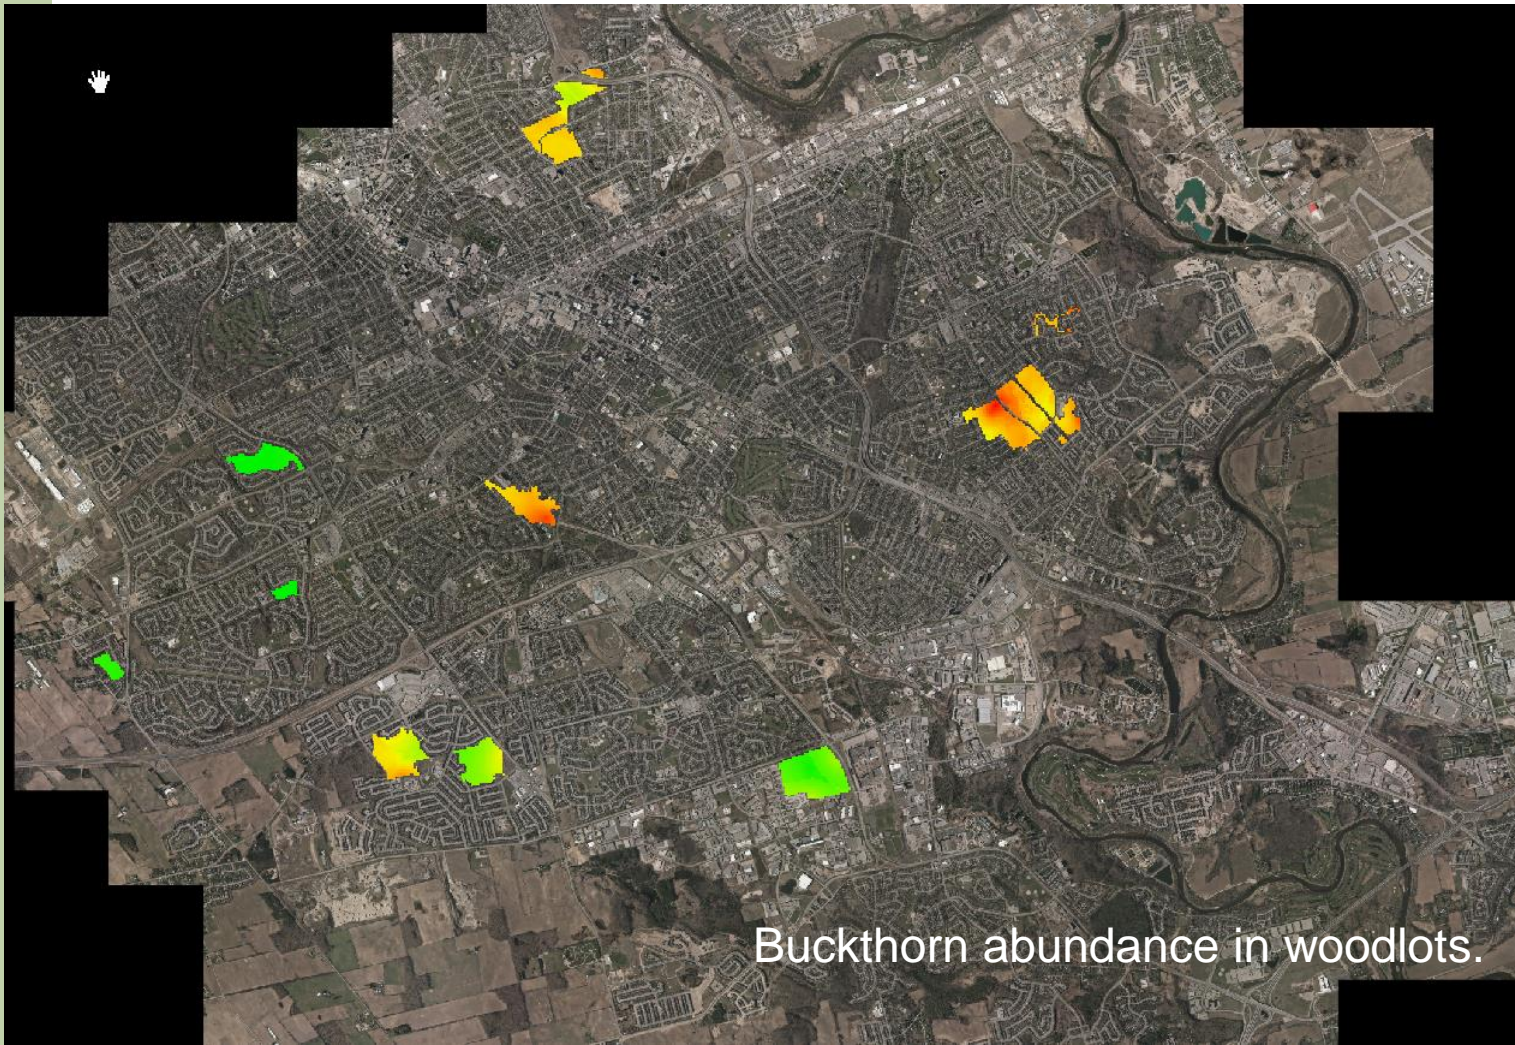

Adaptive management across landscapes

- need to be prioritized using sound inventory and monitoring information.

Inventory and monitoring information

- Is necessary to prioritize conservation and management actions to ensure efficient allocation of resources

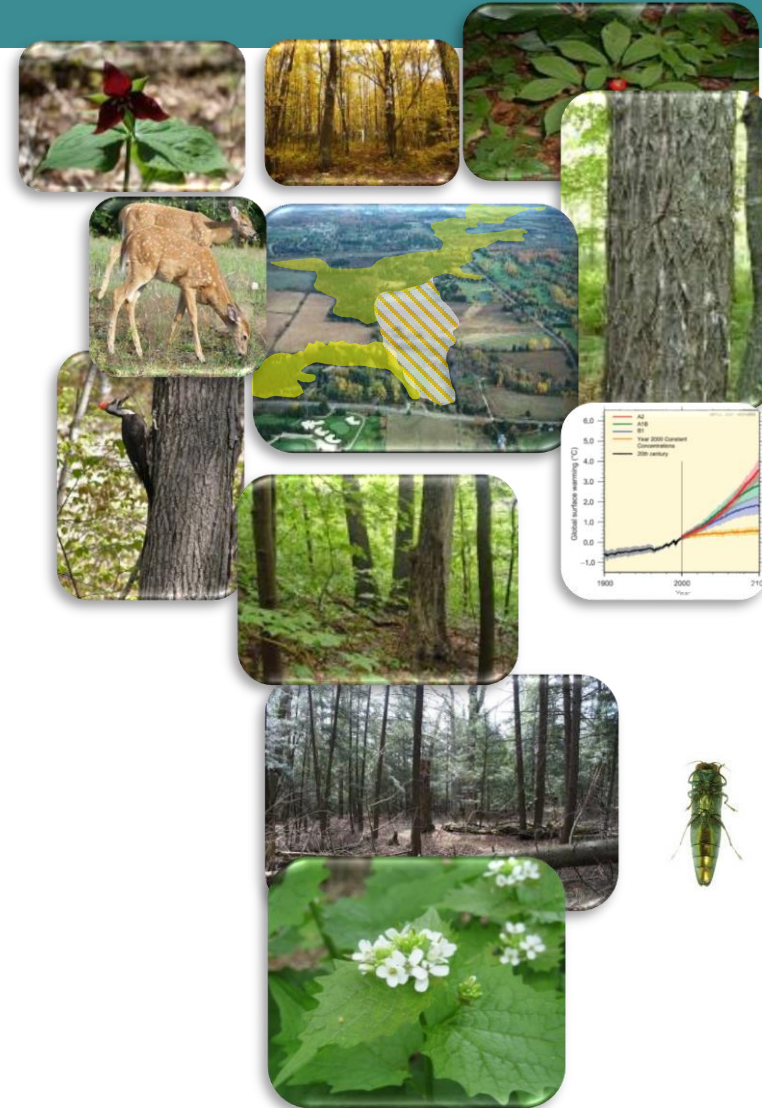

Buckthorn abundance in woodlots.

Integrated inventory and monitoring as part of:

- Land use and landscape planning
- Natural Heritage System planning
- Species at Risk recovery planning
- Biodiversity conservation
- Climate change adaptation
- Forest management
- Estimates of ecological goods and services
- Carbon offsets
- Invasive species management
- And new and unforeseen needs

Satisfying these needs requires a strategic, multiple scales and diverse applications perspective!

Thank you
